5.1.7 Establish the project's common data environment

The appointing party shall establish (implement, configure and support) the project's common data environment (CDE) to serve the overall requirements of the project and to support the collaborative production of information (5.6).

The project's common data environment shall enable:

- a) each information container to have a unique ID, based upon an agreed and documented convention comprised of fields separated by a delimiter;
- b) each field to be assigned a value from an agreed and documented codification standard;
- c) each information container to have the following attributes assigned:
 - status (suitability)
 - revision
 - classification (in accordance with the framework defined in ISO 12006-2)

NA.4.4 Classification

Classification of information within information containers should be in accordance with Uniclass 2015 (the UK implementation of ISO 12006-2).

At this level the components can be linked to individual manufacturers data. This is described in more detail in 'Product Data Definition - A technical specification for defining and sharing structured digital construction product information' (S. Thompson, April 2016).

LEXICON, hosted by the Construction Products Association (CPA), will implement the methodology set out in the Product Data Definition document and facilitate the capture of the following information relating to products:

- Essential Requirements for the Harmonised European Standards (hENs);
- Requirements from other Standard (e.g relevant ISO, EN or BS standards other than those captured above);
- Industry recognised documents;
- Mandated requirements for a specific sector or application e.g. NRM for Chartered Surveyors;
- Non-mandated but recognised within a specific sector e.g. CIBSE Guide M;
- Industry agreed and recognised e.g. identified by a professional institute, trade association or cross-industry group;
- User-defined additional terms proposed for approval and wider adoption.

Healthcare example showing individual components making up the wall panel.

Below: Example of approved product data template from 'Product Data Definition' http://bim-level2.org/globalassets/pdfs/product-data-definition_v2.pdf

Uniclass classification - at Component level

Pr -	Products
Pr_20	Structure and general products
Pr_20_29	Fastener products
Pr_20_29_60	Packings, washers and spacers
Pr_20_29_60_96	Washers

At this level the components can be linked to individual manufacturers data. This is described in more detail in 'Product Data Definition - A technical specification for defining and sharing structured digital construction product information' (S. Thompson, April 2016).

LEXiCON, hosted by the Construction Products Association (CPA), will implement the methodology set out in the Product Data Definition document and facilitate the capture of the following information relating to products:

- Essential Requirements for the Harmonised European Standards (hENs);
- Requirements from other Standard (e.g relevant ISO, EN or BS standards other than those captured above);
- Industry recognised documents;
- Mandated requirements for a specific sector or application e.g. NRM for Chartered Surveyors;
- Non-mandated but recognised within a specific sector e.g. CIBSE Guide M;
- Industry agreed and recognised e.g. identified by a professional institute, trade association or cross-industry group;
- User-defined additional terms proposed for approval and wider adoption.

Below: Example of approved product data template from 'Product Data Definition'

NBS BIM Object Standard

Requirements 1: General 2: Information 3: Geometry 4: Functional 5: Metadata

[About the Standard](#)

NBS BIM Object Standard v2.0

The standard is intended for construction professionals, manufacturers and other BIM content developers to assist in the creation of BIM objects that operate in a Common Data Environment (CDE).

[Introduction](#)[Standardizing BIM Objects](#)[Scope and Purpose](#)[Section 1: General Requirements](#)[Section 2: Information Requirements](#)[Section 3: Geometry Requirements](#)[Section 4: Functional Requirements](#)[Section 5: Metadata Requirements](#)

Section 2

Information requirements

Section 2: Information requirements

This section defines the requirements for the information contained within a BIM object. The scope of this section includes general requirements such as property sets, properties and values, as well as COBie and IFC properties. 

2.1 General

2.1 General

2.2 Values

2.3 Property groups and usage

2.4 Property naming

2.5 IFC

2.6 Facility management properties

2.7 BOS_General

2.8 BOS_Certification

2.9 BOS_Environmental

2.10 Supplementary properties

2.1.3 The BIM object shall have completed values where known, and shall not include unset or undefined values. Where the information is unknown, not applicable or not available, a default value 'n/a' shall be used. If the data type restricts the use of an alphanumeric value, the appropriate value to that property shall be used, e.g. '0' for numeric fields and '1900-12-31T23:59:59' for date fields.

2.1.4 The BIM object shall use units of measurements that are appropriate to its type, intended use and specific domain. The BIM object:

- a) Shall use the Système international d'unités (SI) protocols for dimensions and units generally.
- b) Should use base unit symbols to BS ISO 80000-1.

General changes

We have made one addition to the table, following a request from the [Environment Agency](#). We have also amended and deleted codes that are duplications of codes elsewhere in the tables. See detail below.

Particular changes

v1.6 Code	v1.7 Code	Classification	Notes
En_25_50_04	No change	Art installations	Entity classification amended from <i>Artworks</i> .

v1.6 Code	v1.7 Code	Classification	Notes
En_30_70_33	En_30_70_28	Equipment gantries	Entity classification amended to clarify, renamed from <i>Gantries</i> and renumbered.

v1.6 Code	v1.7 Code	Classification	Notes
En_80_35_44		Junctions	Entity deleted as it is a duplicate of <i>SL_80_35_44 Junctions</i> .
En_80_96_21		Drift tunnel portals	Entity deleted as it is a duplicate of <i>SL_80_96_20 Drift tunnel portals</i> .

v1.6 Code	v1.7 Code	Classification	Notes
-----------	-----------	----------------	-------

Summary

1. A classification system for BIM

2. Industry usage growing

3. Now ingrained in latest NBS tools

NBS Construction Technology Report 2019

Description

NBS Construction Technology Report 2019

Model viewing

It is not just those involved in the creation of a model who need to view it. Clients, those who will use the building, contractors, construction workers and those checking a design's compliance may also need to view it. Buying full modelling licences for these people can be prohibitively expensive; this is where model viewers are useful. Model viewers allow BIM files to be rendered and viewed at a small (or no) cost. They often support a range of file formats, and typically support open formats like Industry Foundation Classes (IFCs). Model viewers can bring BIM to life for those who are unfamiliar with it. They can give all stakeholders a detailed visualisation of a project before construction work commences, thereby providing detailed feedback at a time when it can still be acted upon.

What tools do you use to view, or help others view, your models?

Buying full modelling licences for these people can be prohibitively expensive; this is where model viewers are useful.

Future Tech

The findings of this report suggest that the process of design is undergoing technological transformation. What began with CAD and then moved to 3D modelling is now developing into collaborative work on information-rich models. Practices are increasingly using a blended technology stack to support information-rich design.

The graph below shows where we are now, and where we might be going in the next five years and beyond.

Most striking is the rise of cloud based working: a cornerstone of effective collaborative working. 42% are using the cloud now, and within five years' time that figure is expected to rise to almost 90%. We are nearing the end of desktop applications and local storage.

But we can also see that technologies which recently seemed far off are gaining a real foothold. Virtual, augmented or mixed reality is already being used by a third of practices, and 75% expect to be using it within five years. This offers the opportunity for designers (as well as clients and contractors) to interact in realistic, true 3D rendering of models, and so to make better design choices, in a more collaborative manner.

Just as the UK Government acted as a catalyst for BIM, they are now seeking to promote off-site construction. In the Autumn Budget 2017, the Government outlined its plans to promote off-site construction, with the central government departments looking to adopt a presumption in favour of off-site construction.

Off-site construction offers the potential for buildings to be largely created in factory conditions, and then quickly erected on site afterwards. It offers the benefits of greater automation and efficiency, higher quality and better conditions for workers. Large players like Ascon, Lush, O'Rourke and the Bentley Group are already involved. There's a risk that if the design professions are not involved, they will get left behind. Already, however, 47% are involved in some form of design for off-site construction, and a further third expect to be within five years.

Looking to the other future technologies in the graph, we can see that there is still a great deal of uncertainty. Many don't know if they will be using the technologies listed in the future. However, we do see an industry open to change with, typically, fewer than a fifth ruling out any given future technology.

Current and expected use of the following technologies.
